

## INSERT A FIREPLACE : SEVERAL POSSIBILITIES !

+++++

### Several types of inserts ...

A clear distinction should be made between the fireplaces with retractable door (Stûv 21) and inserts (Stûv 16).

#### >> Stûv 16

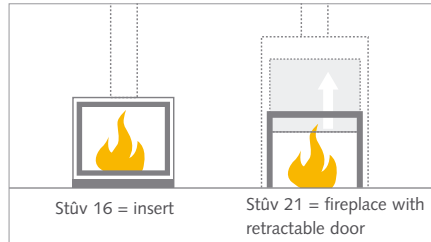

The inserts have - originally - been designed to be integrated without major work into existing fireplaces and provide an efficient and economical heating. They have a compact volume, a ventilator to force hot air and they only function with closed door, not in the open fire position. Thanks to the claddings offered by Stûv, they can also be used as a stove (see picture).

#### >> Stûv 21

The fireplaces with retractable door can be integrated in the architecture, reason why they are suitable for new constructions or consequent renovations. They are larger and allow a heating based on natural convection. They function in the glass door or open fire position.

#### >> Stûv 30-in

The Stûv 30-in is also an insert but one that can function in the open fire position, glass door position and as a slow-burner like a stove. The Stûv 30 can be fitted into a recess, without further work.

+++++

### Maintenance...

Many manufacturers have neglected the easy access to the technical elements built in the masonry, but with Stûv, all parts that need an intervention are accessible in a few seconds.

#### >> Stûv 16

The ventilator and other mechanisms are accessible for the maintenance of the inside of the fireplace.

#### >> Stûv 21

The door tilts forwards for the easy cleaning of the inner face of the glass door and to give access to the system in order to raise it.

+++++

### Plan B

If you do not wish to carry out masonry or decoration work around your fireplace, Stûv offers metal claddings perfectly adapted to the Stûv 21 and Stûv 30-in models.
